What does a neuron compute?

- A neuron computes the mean of all features before applying the output to an activation function
- A neuron computes a linear function (z = Wx + b) followed by an activation function

### Correct

Correct, we generally say that the output of a neuron is a = g(Wx + b) where g is the activation function (sigmoid, tanh, ReLU, ...).

- A neuron computes a function g that scales the input x linearly (Wx + b)
- A neuron computes an activation function followed by a linear function (z = Wx + b)

Which of these is the "Logistic Loss"?

- $\bigcirc \quad \mathcal{L}^{(i)}(\hat{y}^{(i)}, y^{(i)}) = max(0, y^{(i)} \hat{y}^{(i)})$
- $\mathcal{L}^{(i)}(\hat{y}^{(i)}, y^{(i)}) = \mid y^{(i)} \hat{y}^{(i)} \mid^2$
- $\bigcirc \quad \mathcal{L}^{(i)}(\hat{y}^{(i)}, y^{(i)}) = -(y^{(i)}\log(\hat{y}^{(i)}) + (1-y^{(i)})\log(1-\hat{y}^{(i)}) \quad )$

### Correct

Correct, this is the logistic loss you've seen in lecture!

 $\mathcal{L}^{(i)}(\hat{y}^{(i)},y^{(i)}) = \mid y^{(i)} - \hat{y}^{(i)} \mid$

Suppose img is a (32,32,3) array, representing a 32x32 image with 3 color channels red, green and blue. How do you reshape this into a column vector?

0	x = img.reshape((32*32*3,1))
Correct	
	x = img.reshape((32*32,3))
	x = img.reshape((3,32*32))
	x = img.reshape((1,32*32,*3))

4. Consider the two following random arrays "a" and "b":	
1 2 3	a = np.random.randn(2, 3) # a.shape = (2, 3) b = np.random.randn(2, 1) # b.shape = (2, 1) c = a + b
What will be the shape of "c"?	
	The computation cannot happen because the sizes don't match. It's going to be "Error"!
	c.shape = (2, 3)
Corr	
	This is broadcasting. b (column vector) is copied 3 times so that it can be summed to each column of a.
	c.shape = (3, 2)
	c.shape = (2, 1)
	_

5.	

Consider the two following random arrays "a" and "b":
1 a = np.random.randn(4, 3) # a.shape = (4, 3) 2 b = np.random.randn(3, 2) # b.shape = (3, 2) 3 c = a*b
What will be the shape of "c"?
c.shape = (4,2)
The computation cannot happen because the sizes don't match. It's going to be "Error"!
Correct Indeed! In numpy the "*" operator indicates element-wise multiplication. It is different from "np.dot()". If you would try "c = np.dot(a,b)" you would get c.shape = (4, 2).
c.shape = (4, 3)
c.shape = (3, 3)
1/1 point 7.

Recall that "np.dot(a,b)" performs a matrix multiplication on a and b, whereas "a\*b" performs an element-wise multiplication.

Consider the two following random arrays "a" and "b":

- The computation cannot happen because the sizes don't match. It's going to be "Error"!
- c.shape = (12288, 45)

#### Correct

Correct, remember that a np.dot(a, b) has shape (number of rows of a, number of columns of b). The sizes match because :

"number of columns of a = 150 = number of rows of b"

- c.shape = (12288, 150)
- c.shape = (150,150)

8.

Consider the following code snippet:

```
1 # a.shape = (3,4)

2 # b.shape = (4,1)

3

4 for i in range(3):

5 for j in range(4):

clillil = aliillil + blil
```

How do you vectorize this?

- c = a + b
- c = a + b.T

## Correct

- c = a.T + b.T
- c = a.T + b

9.

Consider the following code:

What will be c? (If you're not sure, feel free to run this in python to find out).

This will invoke broadcasting, so b is copied three times to become (3,3), and \* is an element-wise product so c.shape will be (3, 3)

### Correct

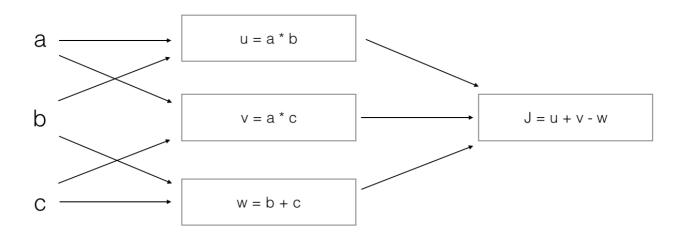

- This will invoke broadcasting, so b is copied three times to become (3, 3), and \* invokes a matrix multiplication operation of two 3x3 matrices so c.shape will be (3, 3)
- This will multiply a 3x3 matrix a with a 3x1 vector, thus resulting in a 3x1 vector. That is, c.shape = (3,1).
- It will lead to an error since you cannot use "\*" to operate on these two matrices. You need to instead use np.dot(a,b)

10.

Consider the following computation graph.

What is the output J?

$$J = (c - 1)*(b + a)$$

$$\int = (a - 1) * (b + c)$$

# Correct

Yes. 
$$J = u + v - w = a*b + a*c - (b + c) = a*(b + c) - (b + c) = (a - 1)*(b + c).$$

$$J = a*b + b*c + a*c$$

$$J = (b - 1) * (c + a)$$
